**InfoRad Inc.
New Product Release**

InfoRad announces Email-Connect™ Wireless Gateway

InfoRad®Email-Connect™ Wireless Gateway is a powerful front end software solution that will process incoming email messages directly through the InfoRad Wireless Enterprise SV messaging software or InfoRad Watch-IT ASCII SV software. Incorporating the Email-Connect™ Wireless Gateway adds additional capability and versatility to your messaging environment while maintaining a high level of control, security and reliability over your enterprise messaging network.

Technically speaking, the InfoRad Email-Connect™ Wireless Gateway output is monitored by InfoRad Enterprise SV or Watch-IT ASCII SV software for an incoming hosted email. Upon detection and confirmation of a valid address, the message or messages are dispatched to the intended receivers. The incoming email address to the gateway can be assigned to an individual receiver or group of receivers within the InfoRad Enterprise or Watch-IT software. The InfoRad Enterprise SV or Watch-IT SV software will validate, direct and/or redirect and log all message transactions to the designated carriers including private systems. Outgoing multiple message protocol support and “Route-On-Failure” are provided via SNPP, WCTP, SMTP and TAP including direct serial TAP.

For your **FREE 30-day** evaluation of the InfoRad Email-Connect™ Wireless Gateway software go to <http://inforad.com/demos.html#advanced> and download your fully functional, fully supported version today!
